

The Path to a Successful SSO/Identity Management Implementation

Washington, DC – October 1, 2007 – Otecia International, a leading global provider of Identity Management solutions, today announced the completion of a large-scale single sign-on implementation for a leading market research firm. The solution based around Oracle Access Manager (OAM) and Oracle Virtual Directory (OVD) allows the client to increase security, reduce costs, achieve compliance, and improve end-user experience.

The client hired Otecia International to build an enterprise-quality security infrastructure hosting new business facilitation applications that enable easier, faster access to enterprise information for customers via the Internet.

“Our client has an aggressive vision that is pushing Identity Management to the frontline of securing its core business. The key factors to Otecia’s success were in bringing expert understanding of the single sign-on and identity management technology, positioning the right resources for the job, spending sufficient time in analyzing use-cases and design, and allocating sufficient time for testing,” said Tim Arafat, senior consultant, Otecia International. “Most identity management projects fail because of poor cost and resource management. Limited technology expertise and the lack of infrastructure readiness are contributing factors. Often the magnitude of the work involved is underestimated. Insufficient time is devoted to requirements gathering, analysis, and design, focusing primarily on the technology side rather than on business goals.”

The project was completed on time with a set of tasks ahead of schedule. Budget costs were not exceeded. Otecia International delivered a secure system that is easy to maintain and monitor, scalable for growth, and backward compatible with existing legacy applications. Oracle Corporation released a white-paper discussing the significance in positioning the right System Integrator at complex identity management projects. A copy of the white paper is available at Otecia International’s web site <http://www.otecia.com/>.
